

Change Request - Scope Definition

Celis Marketplace Platform - Professional System Review

Project Name	Celis Marketplace Platform
Document Title	System Review, Findings and Required Enhancements
Review Scope	Marketplace listing flow, admin portal, reporting, roles, packages and platform configuration
Reference Document	Project Comment and Review.pdf
Change Category	Defect Resolution / Functional Enhancement / Reporting / Access Control
Change Location	Mobile Web / Public Marketplace / Admin Portal
Request Number	CR-CELIS-001
Date Requested	14 July 2026
Prepared By	Project Review Team

Executive Summary

This document converts the observations recorded in the source review into a structured change request with detailed functional requirements and acceptance criteria. The review covers nine primary improvement areas and one set of cross-cutting controls. It is based on the supplied screenshots and comments; it is not a source-code, database, security or infrastructure audit.

Requirements Identified	High Priority	Medium Priority
10	9	1

**FR-01. Mobile Category Dropdown Visibility****High**

Current observation: When the category selector is opened from the mobile listing form, the dropdown appears at a scrolled position and the first category is not visible. This prevents the user from reliably reviewing the full category list from the beginning.

Business impact: Users may select an incorrect category, fail to complete a listing, or create poorly classified inventory. Incorrect categorization reduces search accuracy and increases moderation effort.

Required Change

- The category dropdown must open within the visible mobile viewport and display the first available category when no category has been selected.
- The dropdown must have an internal vertical scroll area with a maximum height calculated from the available viewport, including browser safe areas.
- The page behind the dropdown must not move while the dropdown is open. Touch scrolling must remain smooth and must not become trapped.
- When a category is already selected, the selected value should be brought into view without hiding earlier options from the user.
- The component must support touch, keyboard navigation, focus states, screen-reader labels and the mobile back action.

Figure 1: Category list opened on mobile.

Figure 2: Current generic condition list.

Acceptance Criteria

No.	Acceptance Criterion
1	On supported mobile screen sizes, the first category is visible when the selector opens and every category can be reached by scrolling.
2	The selector does not extend behind browser navigation controls, and no option is clipped or inaccessible.
3	Selecting a category closes the selector and preserves the chosen value when the user proceeds to the next step or returns to the form.
4	The behavior is verified on at least 320 px, 360 px, 390 px and 412 px viewport widths.

**FR-02. Category-Specific Listing Conditions****High**

Current observation: A single generic set of conditions is presented for every listing category. The supplied example shows the same values being used for categories whose condition terminology is materially different.

Required outcome: Condition values must be configured by category so that sellers only see values relevant to the item they are listing. For example, Electronics may use Brand New, Used and Refurbished, while Vehicles may use Brand New and Local Used. The final condition dictionary must be approved by the business owner.

- Create an admin-managed mapping between category and allowed condition values.
- Each condition must include a display label, internal code, sort order, active/inactive status and optional explanatory text.
- The listing form must refresh condition options immediately after the category changes and clear any previously selected condition that is no longer valid.
- Existing listings must retain their historical condition value. A controlled migration must be defined if old generic values are replaced.
- Condition must be required only for categories where it is relevant; categories such as services may be configured without a condition field.

Recommended Initial Mapping

Category	Example Condition Values	Status
Electronics	Brand New; Used; Refurbished	Business approval required
Vehicles	Brand New; Local Used	Business approval required
Other categories	Configured separately by category owner	To be defined

FR-03. Listing Type, Listing Fee and Commission Model**High**

Figure 3: Current listing type field displays "Fixed-rate listing" without sufficient business explanation.

Current observation: The interface displays a fixed-rate listing type, while the review comments question whether commission-on-sale should also be supported. The current terminology does not explain when the seller is charged, how much is charged, or whether both mechanisms can be active at the same time.

Business decision required: Celis must formally approve the monetization model. The system should support a clearly configured model rather than relying on technical settings that may cause unintended double charging.

Supported Models to Define

Model	Definition
Fixed listing fee	A fee is charged when the seller publishes or renews a listing. The fee must be visible before confirmation.
Commission on sale	A percentage or fixed commission is charged only when an order reaches the business-defined

	completed status.
Hybrid model - optional	A listing fee and a sales commission may both apply only when the business explicitly enables and approves this model.

Acceptance Criteria

No.	Acceptance Criterion
1	Only the approved charging model is applied to a listing or transaction, and the seller can see the amount before confirmation.
2	The transaction ledger records the fee calculation inputs and resulting amounts for audit and reconciliation.
3	Changing a fee configuration does not retrospectively alter completed transactions.
4	Duplicate payment callbacks or repeated processing do not create duplicate fees.

No.	Acceptance Criterion
-----	----------------------

FR-04. Expiring-Soon Listing Management	High
---	------

Figure 4: Dashboard shows an "Expiring soon" count, but no detailed management view is available from the evidence supplied.

Current observation: The admin dashboard displays an Expiring soon indicator, but administrators do not have a clear page or report showing which listings are approaching expiry. A summary count without a drill-down action is not operationally sufficient.

Required Change

- Make the Expiring soon dashboard card clickable and open a dedicated filtered list.
- Display listing ID, title, seller, category, package, publication date, expiry date, days remaining, listing status, payment status and last activity date.
- Provide filters for expiry window, seller, category, package, listing status and payment status.
- Provide approved actions such as view listing, notify seller, extend expiry, renew package, suspend, archive or mark expired.
- Support bulk seller notifications and record notification delivery status.
- Automatically change the listing status when the expiry time is reached, according to the approved business rule.

Recommended Expiry Thresholds

- Expires within 1 day
- Expires within 3 days
- Expires within 7 days
- Expires within 14 days
- Already expired

Acceptance Criteria

No.	Acceptance Criterion
1	The dashboard count exactly matches the records returned by the expiring-soon detail view for the same threshold.

No.	Acceptance Criterion
2	Administrators can identify the seller and expiry date of every affected listing without manual database access.
3	Seller notifications are logged with timestamp, channel, recipient and delivery result.
4	When an expiry extension is approved, the previous and new expiry dates are preserved in the audit trail.
FR-05. Separation of External Customers and Internal Users	
High	

Figure 5: Buyers, sellers and administrative users are currently presented in the same user-management area.

Current observation: The user-management screen combines marketplace customers with internal administrative users. Although type and role fields are visible, the combined view creates operational confusion and increases the risk of assigning administrative privileges to an external account.

Required Information Architecture

User Domain	Examples	
External customers	Buyer; Seller; Shop/Business Seller	
Internal users	Super Admin; Admin; Listing Review Officer; Finance/Payout Officer; Support Officer; Auditor	Created through a restricted internal-user workflow and governed by role-based permissions.

Functional Requirements

- Provide separate navigation entries or clearly separated tabs for Customers and Internal Users.
- External customer records must support filters for buyer/seller type, verification, account status, registration date and marketplace activity.
- Internal user records must support role, department/function, status, last login, multi-factor authentication status and permission summary.

- The system must prevent an external customer from being converted to an internal administrator through a simple role dropdown.
- Creating, activating, suspending or changing an internal user role must require an authorized administrator and must be fully audited.
- The Super Admin designation must not be available to ordinary administrators unless explicitly permitted by a higher-level control.

Acceptance Criteria

No.	Acceptance Criterion
1	External customer accounts and internal administrative accounts are visibly separated and searchable independently.
2	Role changes show the previous role, new role, changed by, reason and timestamp in the audit log.
3	Suspending an internal user immediately revokes administrative access without deleting historical activity.

FR-06. Operational and Financial Reporting

Activate Windows
Go to Settings to activate Windows.

Figure 6: Current report page primarily shows financial ledger entries and CSV export.

Current observation: The current report page provides a limited financial ledger view. The source review specifically requests additional visibility for failed payments, users registered today and listings created today. These should be implemented as operational reports with drill-down capability, not only as dashboard totals.

Mandatory Reports from the Source Review

Report	Purpose	Minimum Data Fields
RPT-01 - Failed Payments	Shows unsuccessful payment attempts and supports investigation and retry	Transaction/reference ID; user; seller; amount; currency; payment method; provider reference; error code; error

	decisions.	message; attempt count; initiated time; last attempt; final status; resolution notes.
RPT-02 - New Users Today	Shows all accounts registered during the selected business day.	User ID; name; phone/email; account type; buyer/seller/shop classification; verification status; registration channel; registration timestamp; account status; first activity.
RPT-03 - New Listings Today	Shows listings created during the selected business day.	Listing ID; title; seller; category; condition; price; listing type; package; moderation status; publication status; created time; reviewer; rejection reason where applicable.

Common Reporting Requirements

- All reports must support date and time filters using the configured business timezone.
- Reports must provide search, sorting, pagination and role-based access restrictions.
- Export must support CSV and, where required, PDF. The export must preserve applied filters and include generation time and generated-by user.
- Dashboard totals and report detail must reconcile to the same source of truth.
- Financial reports must display currency and must not mix amounts from different currencies without explicit grouping.
- Sensitive payment-provider error data must be visible only to authorized operational or finance roles.

Recommended Extended Reporting Catalogue

The following catalogue is recommended to provide complete marketplace oversight. It extends the three mandatory reports above and may be delivered in phases.

No.	Report	Coverage
1	Seller Performance	Listings, sales, rating, response, cancellation, complaints and verification status.
2	Buyer Activity	Views, contacts, purchases, cancellations, spend and review activity.
3	Listing Performance	Views, contacts, callback requests, chats and conversion.
4	Listing Fees	Listing-fee charges, waivers, discounts, payments and reversals.
5	Payment Reconciliation	Internal transactions compared with provider records and mismatch status.
6	Callback and Contact Requests	Buyer interest, seller response and conversion outcome.
7	Seller Verification	Verification applications, documents, reviewer decision and expiry.

No.	Report	Coverage
8	Reported Listings and Disputes	Complaints, risk classification, evidence, action and resolution.
FR-07. Internal Role: Listing Review and Seller Verification Officer		High

Roles & permissions

Control what each role can do in the admin dashboard

Buyer Seller **Admin** Super admin **all**

Admin permissions

Access admin area Can log into the admin dashboard admin:access	☒	View audit log Can view the audit log of platform changes audit:read	☒
Manage categories Can create and edit categories categories:manage	☒	Moderate listings Can approve, reject and change listing status listings:moderate	☒
View listings Can view listings in admin listings:read	☒	Manage orders Can update order status orders:manage	☒
View orders Can view orders orders:read	☒	Manage payouts Can retry and complete payouts payouts:manage	☒

Activate Windows
Go to Settings to activate Windows.

Figure 7: Existing role and permission configuration can be extended with a dedicated operational role.

Required role: Create a dedicated internal role named Listing Review and Seller Verification Officer. The role is responsible for marketplace content quality and seller verification, but must not have unrestricted finance, platform configuration or role-administration privileges.

Acceptance Criteria

No.	Acceptance Criterion
1	The new role can complete listing and verification reviews without access to payouts, fees, packages, settings or role administration.
2	Every approval, rejection, suspension, badge action and escalation records the officer, timestamp, decision reason and affected record.
3	Verification documents are accessible only to authorized roles and all access is logged.
4	An officer cannot approve a request that the same officer created or materially modified when maker-checker control is enabled.

FR-08. Listing Package Configuration and Assignment

Medium

Listing packages
Manage packages for shop sellers

Assign to seller Add package

Package	Listings	Duration	Price	
Maamus LTD m	10	30 days	0 USD	Edit
Shop Unlimited Unlimited listings for 30 days	999999	30 days	0 USD	Edit

Activate Windows
Go to Settings to activate Windows.

Figure 8: Listing packages currently show listing quantity, duration and price, including a very large numeric value used to represent unlimited listings.

Current observation: The package screen shows a package with a fixed listing quantity and another package with the value 999999, apparently used to represent unlimited listings. Using an artificial large number is difficult to understand, may leak into reporting and can create unexpected limit behavior.

Required Package Fields

- Package name and unique code
- Seller type or eligibility rule
- Listing quota or explicit Unlimited flag
- Duration in days and expiry behavior
- Price, currency and tax treatment
- Listing-fee or commission override, where approved
- Featured or promoted listing allowance
- Auto-renewal and grace-period rules
- Active/inactive status and effective dates
- Assignment source, payment reference and assigned-by user

Functional Requirements

- Prevent a seller from publishing beyond the active package limit and display the remaining quota to the seller and administrator.
- Define whether expired packages hide listings, unpublish listings, allow a grace period or permit read-only visibility.
- Package assignment must record start date, end date, price paid, payment status, assignment method and audit information.
- Changes to a package definition must not silently alter already purchased packages unless the business explicitly applies a migration.

- The system must support package activation, deactivation and versioning so historical transactions remain explainable.

Acceptance Criteria

No.	Acceptance Criterion
1	Unlimited packages are displayed as Unlimited in the interface and reports, with no artificial numeric quota exposed.
2	A seller cannot exceed the active package quota and receives a clear renewal or upgrade message.
3	Package expiry behavior is consistent across listing status, seller dashboard, admin reports and notifications.
4	The package assigned to a seller can be traced to the administrator or payment transaction that created the assignment.
FR-09. Platform Settings, Fees and Feature Toggles	
High	

Figure 9: Current configuration exposes technical units such as cents and basis points together with multiple feature toggles.

Current observation: The settings screen exposes a listing fee in cents and commission in basis points, together with toggles for packages, shipping, commission, wallets and other payment features. These settings require clearer business labels, validation, dependency controls and audit protection.

Required Improvements

- Display monetary values using the configured currency and a business-readable amount. For example, if the platform currency is USD, 100 cents should be displayed as USD 1.00.
- Display commission as a percentage while retaining basis points internally where technically required. For example, 500 basis points equals 5.00 percent.
- Add helper text explaining when each fee is charged and which modules depend on each toggle.
- Validate listing fees as non-negative values and commission as an approved range. A commission must never exceed the business-approved maximum.
- Require a confirmation dialog showing the old and new value before saving a fee or enabling a financial feature.

- Apply effective dates where a change should affect only future listings or transactions.
- Restrict fee and payment settings to authorized roles, preferably with maker-checker approval for high-risk financial changes.
- Record all setting changes in an immutable audit log with previous value, new value, actor, reason, time and environment.

Acceptance Criteria

No.	Acceptance Criterion
1	Administrators see fees in understandable currency and percentage formats, with the underlying technical value calculated consistently.
2	Invalid values, missing dependencies and unauthorized changes are rejected before saving.
3	A financial setting change is effective only from the approved time and does not modify historical calculations.
4	Every setting change is traceable in the audit log and cannot be removed by ordinary administrators.
